Nemetschek Licence Server Option

More flexibility and efficiency for your office thanks to centralized License Management

Nemetschek license server helps you use your software more efficiently by providing central and dynamic access to all the Allplan workstations installed in your office.

Using Existing Workstations Efficiently

The license server provides a better use of existing licenses. Allplan can be installed on all the computers that are networked in your office. A license is only queried when the program is started. If an unused license is still available, the license server provides access to this license. This is very economical even if there are just a few workstations. If, for example, five workstations in your office are equipped with Allplan but these workstations are not used consistently due to visits to building sites, meetings or breaks, the licenses can be used by another workstation in the meantime. In the above example, this is equivalent to an additional workstation.

Increased Flexibility

The license server facilitates a flexible use of existing licenses. Every user selects the desired Allplan package. If the selected package is not in use at the moment, it starts. No additional hardlock is required and no additional license file needs to be installed. Licenses can also be checked out temporarily for work outside the office, so Allplan can be run without a hardlock.

Increased Security and Simplified Handling and Administration

The license server is only installed on one computer in the network. Only this computer is equipped with the license file and the Nemetschek hardlock. For example, an existing data server in a locked server room can be used as the Nemetschek license server. Thus, the Nemetschek hardlock is protected against theft. In addition, Nemetschek offers a Security-Dongle agreement for a small monthly fee. This agreement covers high replacement costs in the event of loss or theft.

Simplified Administration of Nemetschek Licenses

All the licenses that are available in the entire office are managed by one license file and one hardlock. When using the license server, you do not need to install the licenses appropriate to the hardlock on each workstation. All you need to do is install one hardlock and one license file on a central computer. This is sufficient for the entire office. When you purchase new licenses, simply install the new license file and everyone can access the new licenses.

Highlights

- ▶ Optimum use of software workstations all day long
- ▶ Access for all employees to software modules only installed on certain computers
- ▶ No license disks and hardlocks
